

# UM2117 User manual

Graphical user interface (GUI) for EVAL-L9907

### Introduction

This document describes the STSW-L9907 the Graphical User Interface (GUI) dedicated to set and control the EVAL-L9907 board (3-phase BLDC motor application boards for L9907) through the SPI protocol, manage the Enable and BST\_Dis pins and read the value from the current sensing section.

The STSW-L9907 has been developed using Labview<sup>®</sup> and it works with SPC560P-DISP evaluation board programmed with a dedicated FW (GP-Pictus.elf).

# **1** Graphical User Interface description

The STSW-L9907 GUI includes the fields highlighted in *Figure 1*:

Figure 1. STSW-L9907 Graphical User Interface (GUI) for EVAL-L9907

- 1. Com Port Setup: this menu allows to set the COM port
- 2. **SDI**: this menu allows to select and to configure each device register. It is possible program all the bits of each register.
- 3. **SDO**: the value of each register is copied in the field of this menu. This portion of the GUI allows to monitor the device status.
- 4. **SPI Send/Receive**: in this portion of the GUI it is possible:
  - a) To end an SPI commands or configuration as programmed in the SDI menu (see #2) by pressing the "SEND" button.
  - b) To send a single SPI command manually written in the MOSI field (HEX format). In the same time is available to read the register value in the MISO filed.
  - c) **SPI functionality**: the LEDs, SPI SEND OK and SPI RECEIVE OK provide a visual feedback about the SPI communication status (if the LEDs are on means communication is working properly).
- PWM signals: the Frequency and the Duty cycle of the each PWM signals are programmed in this frame. The "START" button enables the PWM signal generators (PWM signals: L1, L2, L3, H1, H2 and H3), whereas "STOP" button stops the the PWM

signals. Before sending a PWM configuration, the selected Frequency must be confirmed by pushing the "*SET*" button.

- ENABLE SETUP BST\_DIS SETUP & FS\_FLAG STATUS: this frame is used is to configure the EN1, EN2 and BST\_DIS pins of the L9907 and to read the FS\_FLAG status.
- 7. ADC READ: this section displays the value of the lb1 and lb2 pins (ADC inputs).
- 8. **MOTOR CONTROL**: this menu is used to start a BLDC Motor Control based on Closed Loop and by using 6-Steps Algorithm technique, to setup some parameters and to view some useful waveforms:
  - a) **Motor Parameters**: through this menu it is possible to setup some parameters of the BLDC Motor, such as "Polar Couples", minimum and maximum rotation speed.
  - b) **Closed Loop Tuning**: through this menu it is possible to setup the PI parameters for Closed Loop and Kp and Ki values.
  - c) **Graphics Display**: with this button it is possible to select the a graph between Speed, Error, Duty, ADC IB1 and ADC IB2.
  - d) Speed Ref.: by using this cursor it is possible to set the target BLDC motor speed.
  - e) Single Read: this button allows to read the instantaneous speed value.
  - f) **Duty %**: it shows the value of the current Duty Cycle.
  - g) Graph ON/OFF: the button allows to turn ON and OFF the Graph window.
- Automatic Reset: Through this two buttons it is possible to automatically reset the device at Start-up for Vcc=3,3V and Vcc=5V. Pressing the button "*Automatic Reset 3.3 V*', the procedure described at Par. 3 point A will be automatically performed. Pressing the button "*Automatic Reset 5 V*', the procedure described at Par. 3 point B will be automatically performed.
- 10. **HELP**: through this menu it is possible to download the SW help, the L9907 Datasheet and info about the HW.

### 2 How to use the GUI to configure and test the EVAL-L9907

The following procedure has to be followed to start the EVAL-L9907 Device using the L9907 GUI.

#### A. Start up at Vcc= 3.3 V

- 1. Configure the COM port
- 2. Press "OK" button
- 3. Send the SPI frame 0xC800 (0b 110010000000000) DIAG & 0xE000 (0b- DIAG2
- 4. In the field #3 (see previous paragraph) it is possible to read the device answer in bit in the field n° 4 is possible to read the SDI and SDO signals expressed in hex.
- 5. Check the FS\_FLAG status (field #6). The value must be 01

#### B. Start up at Vcc= 5V

The Power Up default value for Vcc over voltage threshold is "10", corresponding to Vcc=3.3V application. The below procedure have to be followed in order to use Vcc=5V (for more details see the EVAL-L9907 HW Manual):

- 1. Configure the COM port
- 2. Press "OK" button"
- 3. In field #7, force one of the EN pins to 0
- 4. Send the command 0x2401 (0b 001001000000001) CMD1 register in order to reset the fault.
- 5. Press "SEND" in the field #4. If the communication has been established and the command have been sent and interpreted properly, the LED "SPI SEND OK" will be turned on. The LED "SPI RECEIVE OK" it will be turned on if the device answer has been received properly.
- 6. The field #3 will be updated with the device registers value as well as in the field #4 the SDI and SDO expressed in hex
- Send the SPI frame 0xC800 (0b 11001000000000) DIAG & 0xE000 (0b11100000000000) - DIAG2
- 8. Set High the EN pin previously set to zero (step 3).
- 9. Check the FS\_FLAG status (field #6): the value should be 01

#### C. How to start the PWM independently

- 1. Set the desired channel (L1, L2, L3, H1, H2 and H3) Field #5
- 2. Insert the frequency value in the field #5.
- 3. Press "SET".
- 4. Set Duty Cycle value.
- 5. Press "START", to enable the PWM signals
- 6. In the field #5, press "STOP PWM" to stop the PWM signals.
- 7. Press the button "STOP" on the top side of the GUI to stop the execution of Labview code and close the window.

#### D. How to start the MOTOR CONTROLL

- 1. STOP all the PWM signals by pressing "STOP PWM" for all 6 channels (L1, L2, L3, H1, H2 and H3), see Field #5. This action will stop all PWM signals from L9907.
- Follow the procedure described at point A or B or press one of the two button *"Automatic Reset 3.3 V"* or *"Automatic Reset 3.3 V"* depending on the Vcc supply value.
- 3. Setup the BLDC motor parameters (polar couples, min and max speed)
- 4. Set Kp and Ki values (for example by using a for a 60W BLDC motor set Kp= 10 and Ki=5)<sup>(a)</sup>
- 5. Press "Start/Stop Motor" button and the motor will start to run. If the Motor shaft doesn't turn means a fault is present. Stop the Motor Control and reset the fault following the procedure at section A, point 3 to 5. Restart the motor control<sup>(b)</sup>.
- 6. Set the rotation direction: Clockwise or CounterClockwise
- 7. Press "Start/Stop Motor" to stop the Motor shaft.
- 8. Press the button "STOP" on the top side of the GUI to stop the execution of Labview code and close the window.

b. Due to the Start-up procedure developed in the Firmware, depending on the BLDC motor and the BLDC rotor position, a cross conduction between high-side and low-side Power MOSFET could happen; under this working a fault is detected.

a. The Kp and Ki constants depend on the BLDC motor characteristics and must be tuned to achieve the best control

### 3 How to plug SCP560P-DISP and EVAL-L9907

In the SPC560P-DISP is implemented a 0.1" 4x37 pin array; it is used as connector to plug the EVAL-L9907.

Figure 2. SPC560P-DISP

Figure 3. SPC560P-DISP – 4x37 Connector, pin "A-34"

Figure 4. SPC560P-DISP – 4x37 Connector, pins used to connect the EVAL-L9907

Figure 5. EVAL-L9907 and SPC560P-DISP

Figure 6. EVAL-L9907 and SPC560P-DISP plugged

### 4 SPC560P-DISP: USB drivers installation

The GUI needs a dedicated USB driver to enable the serial communication channel. If the driver is not yet installed or not appropriately configured, the following procedure describes how to install the Driver or to update the current version.

To install the drivers the board SPC560P-DISP does not need the external supplier; the USB connection provides the supply voltage.

- 1. Disconnect the USB from SPC560P-Discovery
- 2. If the UDE Visual Platform 4.2 is already installed as well as the drivers are updated go to step #7 otherwise continue to next step
- 3. Download the SPC5-UDE/STK 4.02.07 from pls-mc web site.
- 4. Install the SW; right click on the icon named "ude-4-02-07-spc5-udestk.exe" then select "Run as Administrator"

Figure 7. UDE software
UDE Visual Platform 4.2

5. Accept to install the USB drivers (see Figure 8)

#### Figure 8. USB driver installation

15. The COM port is configured and available to be used for serial communication with the PC.

## 5 Labview Driver: Installation Guide

The STSW-L9907 GUI can be used stand alone without a Labview license installing the free SW named "Runtime Engine for Labview" and "VISA Runtime", last versions can be downloaded from NI web site.

51

### 6 SPC560P-DISP: Load Firmware

To use the STSW-L9907 GUI a dedicated FW (file name: "GP-Pictus.elf") must to be loaded on the microcontroller in the SPC560P-DISP board following the below procedure (the board is supplied by the USB cable thus the external PSU is not required):

1. Run "UDE Visual Platform";

2. Create a New Workspace for SPC560P-DISP. Click File>New Workspace

	dit Config Win			
	w Workspace	Ctrl+N		
	en Workspace	Ctrl+O
